*Products Liability Law* Aug 08 2020 *Products Liability Law, Second Edition*, by prolific tort scholar Mark Geistfeld, represents the "next

generation” of casebooks on products liability. Earlier texts focused on the relative merits of strict liability and negligence, embodied in the apparently competing liability frameworks of the consumer expectations test in the Restatement (Second) of Torts and the risk-utility test in the Restatement (Third) of Torts. The majority of courts, however, have incorporated the risk-utility test into the framework of consumer expectations. By providing balanced coverage of both consumer expectations and the risk-utility test, the casebook keeps pace with ongoing developments in the case law and moves beyond the battles that largely defined products liability in the twentieth century. In addition to teaching students how liability rules protect consumer expectations via comprehensive application of the risk-utility test, this innovative casebook underscores the importance of doctrinal history, the psychology of evaluating product risks, and the role of products liability in the modern regulatory state. Students will learn how courts have applied established doctrines to novel problems ranging from the relevance of scientific evidence in toxic-tort cases to the distribution of defective products on the Amazon online marketplace. To further illustrate this dynamic, the casebook has twenty-nine problems with associated analysis involving the liability issues likely to be raised by the emerging technology of autonomous vehicles. Finally, the casebook reinforces students’ knowledge of fundamental tort principles while developing specialized expertise and a deeper understanding of the torts process. New to the Second Edition: A dozen new main cases updating older case law, providing coverage of new issues not addressed in the First Edition, and/or improving upon the analysis provided by the associated case in the First Edition Retention of the majority of main cases from the first edition, with revisions to the ensuing notes incorporating relevant case law developments A reorganized and updated chapter covering the controversy over the relative merits of the consumer expectations and risk-utility tests Comprehensive discussion of the tort version of the implied warranty—the genesis of the consumer expectations test—and its relation to product malfunctions and the risk-utility test A new chapter addressing the existence of the tort

duty and identifying the difference between patent dangers and patent defects Reorganization of the chapter on factual causation, emphasizing the continuity of evidentiary problems running across different types of cases, ranging from the heeding presumption in warning cases, to market-share liability, to proof of both general and specific causation in toxic-tort cases Professors and students will benefit from: Classroom-tested materials taught for over 20 years by an award-winning professor Interesting cases that illustrate both the traditional and contemporary character of products liability litigation; cases are followed by extensive notes Each chapter addressing doctrinal issues concludes with problems on autonomous vehicles. The full set of 29 problems provides students with the necessary background for understanding liability issues posed by this emerging technology. Each problem is followed by the author’s analysis of the associated issues, cross-referenced to the relevant casebook material.

*Professional Issues in Software Engineering* Mar 27 2022 Nowadays software engineers not only have to worry about the technical knowledge needed to do their job, but they are increasingly having to know about the legal, professional and commercial context in which they must work. With the explosion of the Internet and major changes to the field with the introduction of the new Data Protection Act and the legal status of software engineers, it is now essential that they have an appreciation of a wide variety of issues outside the technical. Equally valuable to both students and practitioners, it brings together the expertise and experience of leading academics in software engineering, law, industrial relations, and health and safety, explaining the central principles and issues in each field and shows how they apply to software engineering. Talking Safety Apr 27 2022 Talking Safety summarises in a short user-friendly read the key element of safety leadership - the management and supervisor 'walk and talk'. Safety standards are set by a combination of three things: first, the basic systems: risk assessments, procedures, training, inductions and maintenance; second, the amount of objective learning about the inevitable weaknesses in these systems achieved from a 'Just Culture' perspective; and third, the

quality of 'transformational' safety leadership which means coaching not telling, praising not criticising, leading by example and maximising front-line ownership and involvement. A good 'walk and talk' is the only methodology that covers all of these issues and really should be embedded as 'part of the way we do things around here'. It is the centrepiece of any world class safety culture. Although covering all the key safety research findings by academics including Sidney Dekker, Andrew Hopkins and James Reason as well as latest influencing skills techniques from recent advances such as 'nudge' theory it is written in an accessible style using everyday examples and case studies. You can use any of the five simple steps it outlines to make a difference day to day. Employ its advice fully and it will help you embed safety thinking, transform your safety culture and make safety part of 'the way we do things around here'.

*A Review of Pedestrian, Cyclist, and Micromobility User Safety in the Austin West Campus Neighborhood* Jan 13 2021 The safety of users of alternative modes of transportation is incredibly important for usage and accessibility to local services, public transit, resources, and amenities. As the City of Austin continues to grow, and the West Campus neighborhood continues to densify, it is important for the city to consider the safety of pedestrians, cyclists, and users of micromobility options (i.e., dockless electric scooters) and other alternative modes of transport. Safe roadway networks and adequate alternative transportation infrastructure, such as bike lanes and well-maintained sidewalks, are especially relevant for individuals with mobility related disabilities. How safe and protected from vehicular traffic individuals feel impacts how they get around. Occurrences of traffic incidents involving vehicles and pedestrians/cyclists/e-scooter users can deter people from utilizing these more climate and environmentally friendly transportation options. As the West Campus neighborhood generally consists of students who do not use personal vehicles to travel to the UT Austin campus, it is important for the City of Austin to consider the safety of people not using motorized vehicles. This professional report will focus on pedestrian, bicyclist, and micromobility user safety in the West Campus neighborhood in Austin, TX. Specifically, it will analyze traffic incidents involving these modes from 2012 through 2021, and what the City of Austin has implemented to improve safety for users of non-motorized forms of transportation. With the recent amendments and implementation of the

University Neighborhood Overlay (UNO) and other development density bonuses that have allowed for taller residential towers and greater population density, it is even more important to consider the safety of pedestrians and users of alternative modes of transportation, such as bicycles, e-scooters, and public transit (Austin, TX L.D.C. Ordinance No. 040902-58, 2004). The greater number of students and other residents in West Campus will impact crash rates. The City of Austin needs to account for this potential population growth and consider street infrastructure improvements, especially in areas with greater crash rates. With the city's Vision Zero initiative, and the future implementation of Project Connect, pedestrian, cyclist, and e-scooter safety should receive greater attention and consideration

**Hierarchical Decision Modeling** Mar 15 2021 This volume, developed in honor of Dr. Dunder

F. Kocaoglu, aims to demonstrate the applications of the Hierarchical Decision Model (HDM) in different sectors and its capacity in decision analysis. It is comprised of essays from noted scholars, academics and researchers of engineering and technology management around the world. This book is organized into five parts: Technology Policy Planning, Strategic Technology Planning, Technology Assessment, Application Extensions, and Methodology Extensions. Dr. Dundar F. Kocaoglu is one of the pioneers of multiple decision models using hierarchies, and creator of the HDM in decision analysis. HDM is a mission-oriented method for evaluation and/or selection among alternatives. A wide range of alternatives can be considered, including but not limited to, different technologies, projects, markets, jobs, products, cities to live in, houses to buy, apartments to rent, and schools to attend. Dr. Kocaoglu's approach has been adopted for decision problems in many industrial sectors, including electronics research and development, education, government planning, agriculture, energy, technology transfer, semiconductor manufacturing, and has influenced policy locally, nationally, and internationally. Moreover, his students developed advanced tools and software applications to further improve and enhance the robustness of the HDM approach. Dr. Kocaoglu has made many contributions to the field of Engineering and Technology Management. During his tenure at Portland State University, he founded the Engineering and Technology Management program, where he served as Program Director and later, Department Chair. He also started the Portland International Conference on Management of Engineering and Technology (PICMET), which organizes an annual conference in international locations such as Korea, Turkey, South Africa, Thailand, and Japan. His teaching has won awards and resulted in a strong sense of student loyalty among his students even decades later. Through his academic work and research, Dr. Kocaoglu has strongly supported researchers of engineering management and has provided tremendous service to the field. This volume recognizes and celebrates Dr. Kocaoglu's profound contributions to the field, and will serve as a resource for generations of

researchers, practitioners and students.

Journalism in the Age of Virtual Reality Mar 03

2020 With the advent of the internet and handheld or wearable media systems that plunge the user into 360o video, augmented—or virtual reality—technology is changing how stories are told and created. In this book, John V. Pavlik argues that a new form of mediated communication has emerged: experiential news. Experiential media delivers not just news stories but also news experiences, in which the consumer engages news as a participant or virtual eyewitness in immersive, multisensory, and interactive narratives. Pavlik describes and analyzes new tools and approaches that allow journalists to tell stories that go beyond text and image. He delves into developing forms such as virtual reality, haptic technologies, interactive documentaries, and drone media, presenting the principles of how to design and frame a story using these techniques. Pavlik warns that although experiential news can heighten user engagement and increase understanding, it may also fuel the transformation of fake news into artificial realities, and he discusses the standards of ethics and accuracy needed to build public trust in journalism in the age of virtual reality. *Journalism in the Age of Virtual Reality* offers important lessons for practitioners seeking to produce quality experiential news and those interested in the ethical considerations that experiential media raise for journalism and the public.
